

## Solar cell application system

### Overview

Photovoltaics (PV) is a way of harnessing solar energy to transform it into electricity. Solar panels are made up of PV cells built with a semiconductor material that reacts with the impact of photons of light. When a solar PV cell receives the impact of a photon, it can displace one electron. This solar PV application consists of the use of solar panels and a power inverter. Photovoltaic solar panels provide electricity in the form of direct current (DC). Off-grid solar systems are not connected to the electrical grid. The number of uses and applications of solar photovoltaic systems is almost infinite.
